

ADULT-TYPE GRANULOSA CELL TUMOR OF THE TESTIS. REPORT OF A CASE

José I López

Department of Anatomic Pathology, Hospital de Basurto, Basque Country University, Bilbao, Spain

A new case of adult-type granulosa cell tumor of the testis in a 77-year-old man is reported. The patient was healthy and asymptomatic and only showed a discrete left hydrocele. The orchiectomy specimen showed the typical histology of

this entity, with prominent nuclear grooving and Call-Exner-like bodies as the main features. The literature on this exceedingly rare tumor in the testis is reviewed and briefly commented upon.

Key words: adult-type granulosa cell tumor, histological diagnosis, hydrocele, testis.
