ABSTRACT

The female genital tract is an infrequent site of metastasis, in particular from extra-genital primary tumors such as non-small cell lung cancer. Ovarian metastases have been described as disseminations of lung adenocarcinoma; rare cases of secondary localizations in adnexa, cervix and vagina were also observed in the literature, but none of these had endometrial involvement. We report the first case, to our knowledge, of non-small cell lung cancer with metastatic spread to the endometrium.

Key words: non-small cell lung cancer; lung adenocarcinoma, endometrial metastasis.
