ABSTRACT

In recent years we have seen an increase in the frequency of cesarean sections. We present a case report of an endometrioid adenocarcinoma arising from abdominal wall endometriosis in a patient with a history of cesarean sections and describe its diagnostic and therapeutic management.

Key words: cesarean section, endometriosis, malignant transformation.

Acknowledgments: We wish to thank doctor Anne West Honart.

Authors' role: Each author wrote a specific part of the article and read and approved the final report. None of the authors have any financial interests or potential conflicts of interest.
